

Per-donor pathway enrichment in HFpEF (Step 3)

snRNA / CellChat; two co-primary axes. Cell = BH-Wilcoxon stars + Hodges-Lehmann shift. Red = up in HFpEF.

Within-modality (snRNA) evidence only; color = significance, HL text = effect size (they can diverge).

UNC5/FLRT/ADGRL pass both axes here, but ADGRL (faded, dashed, 'out') is adjudicated OUT of the locked core by orthogonal bulk (Fig 3).

Stars: ****<1e-4 ***<1e-3 **<1e-2 *<0.05. n = 18 HFpEF vs 24 control donors.
