

Per-donor co-expression of FLRT2 & UNC5C in fibroblasts (CB layer)

Receptor UNC5C near-ceiling / high baseline in both groups (higher in HFpEF but modest ~1.1x fold, ceiling); ligand FLRT2 (~2.2x) is the driver -> autocrine-competent pool expands ~2.5x.

Per-donor proportions (not cell-level pooled); exact Wilcoxon rank-sum, no ties. Each point = one donor. CellBender layer excludes ambient.
co-detection: per-donor obs/expected = 1.02 [1.01, 1.04] (~2% above independence; formally significant at n=42, p=0.0063, but negligible) and NOT HFpEF-specific (HFpEF 1.02 vs control 1.02).
